

A graph interpreter for DSP/ML stream-based processing

IoT-SW
4Q24

© 2024 Arm

Summary : DSP/ML is complex and it slows time-to-market

Complexity from the “physical domains” and the “software computation domains”

⇒ Split the problem in smaller pieces (“computing nodes”), let them have the same prototype

⇒ Create a framework to ease integration of DSP pre-processing coupled with classifiers

April 2024

Your Global IoT Market Research Partner

Time to market for IoT-connected products

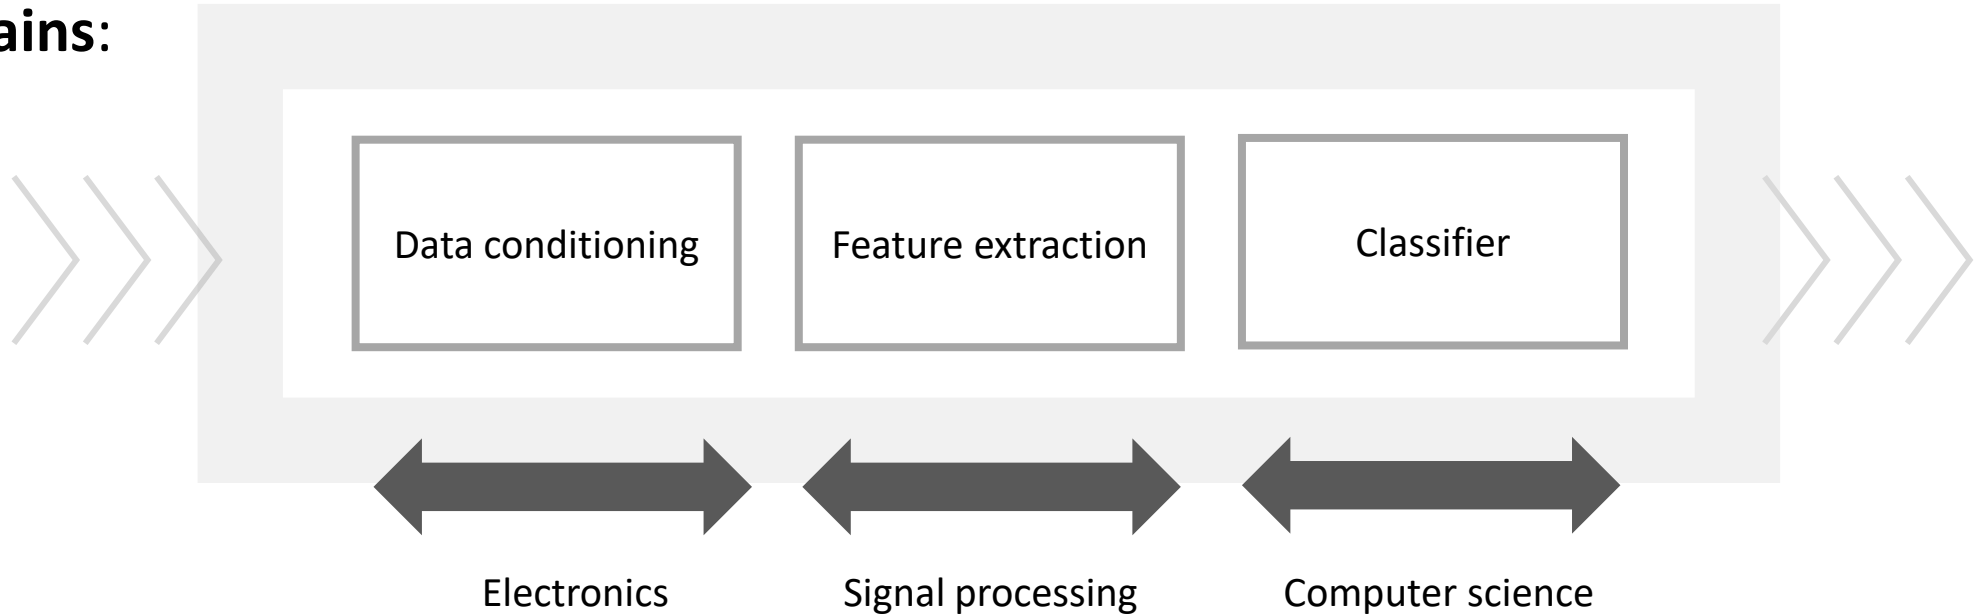

Note: *Time to market = time needed (in months) to get from project kick-off to first paying customer.

Stream-based processing - different domains of expertise

Different **data**
physical domains:

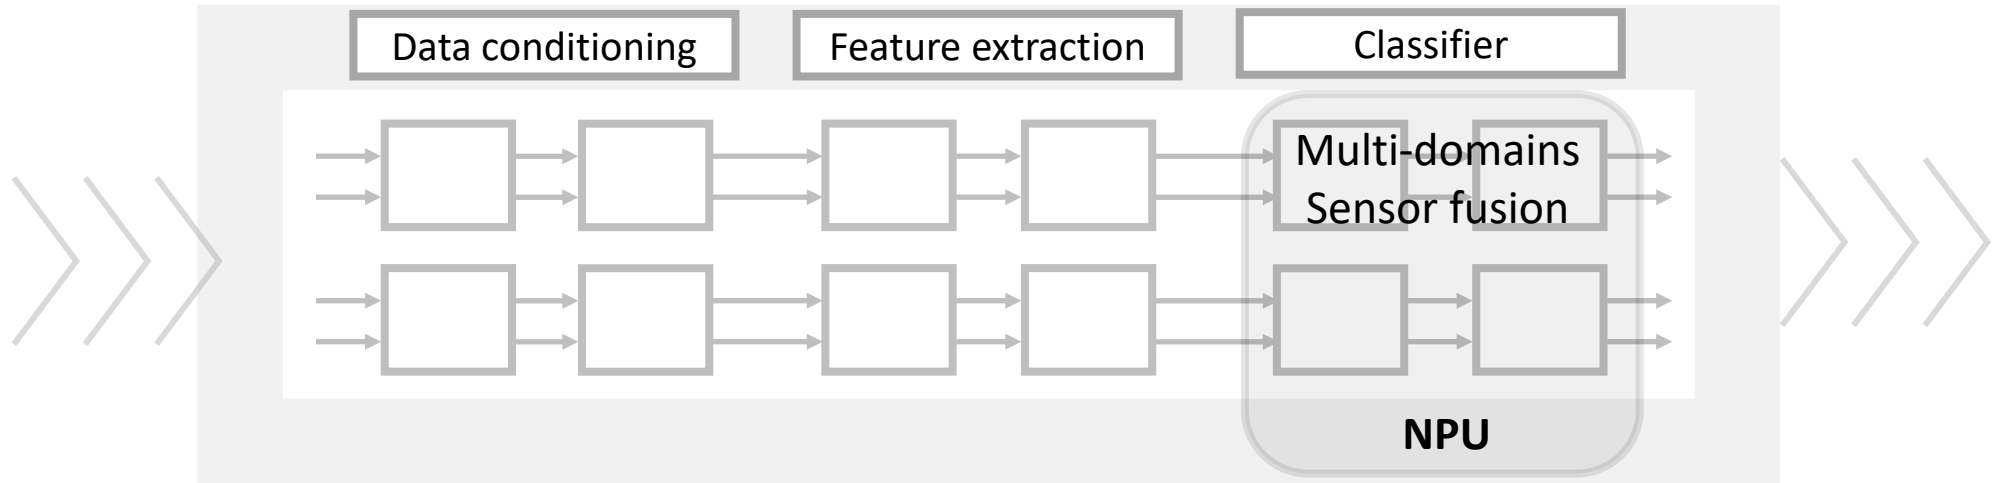

- Acoustics
- Electrical
- Chemical
- Mechanical
- ...

Different **software engineering domains**

Stream-based processing with graph of computing nodes

- Acoustics
- Electrical
- Chemical
- Mechanical
- ...

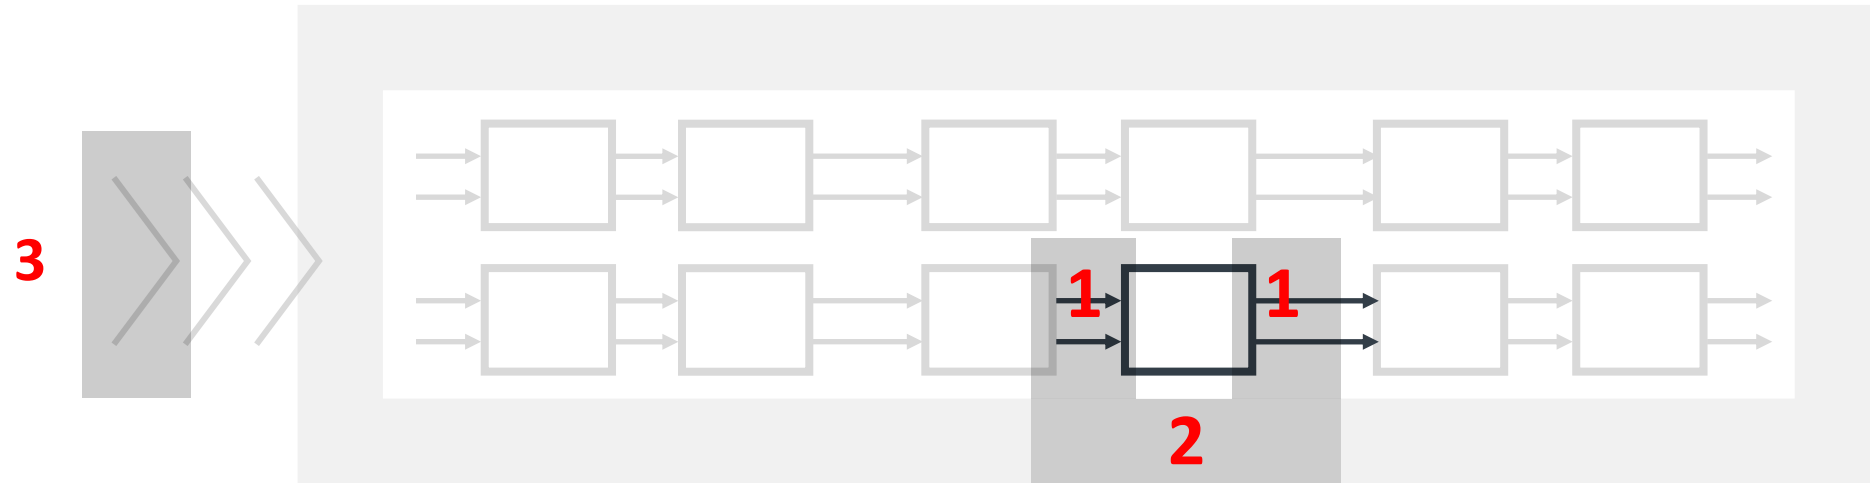

Stream-processing implemented with a graph of computing nodes **designed independently** (different providers)

The proof of concept is in production with the graph of [EEMBC audiomark](#) using a [classifier node](#) (Key Word Spotting) running with or without Ethos-U55 with the same interface.

Manifests of interfaces for Nodes, Graph-I/O, Processor

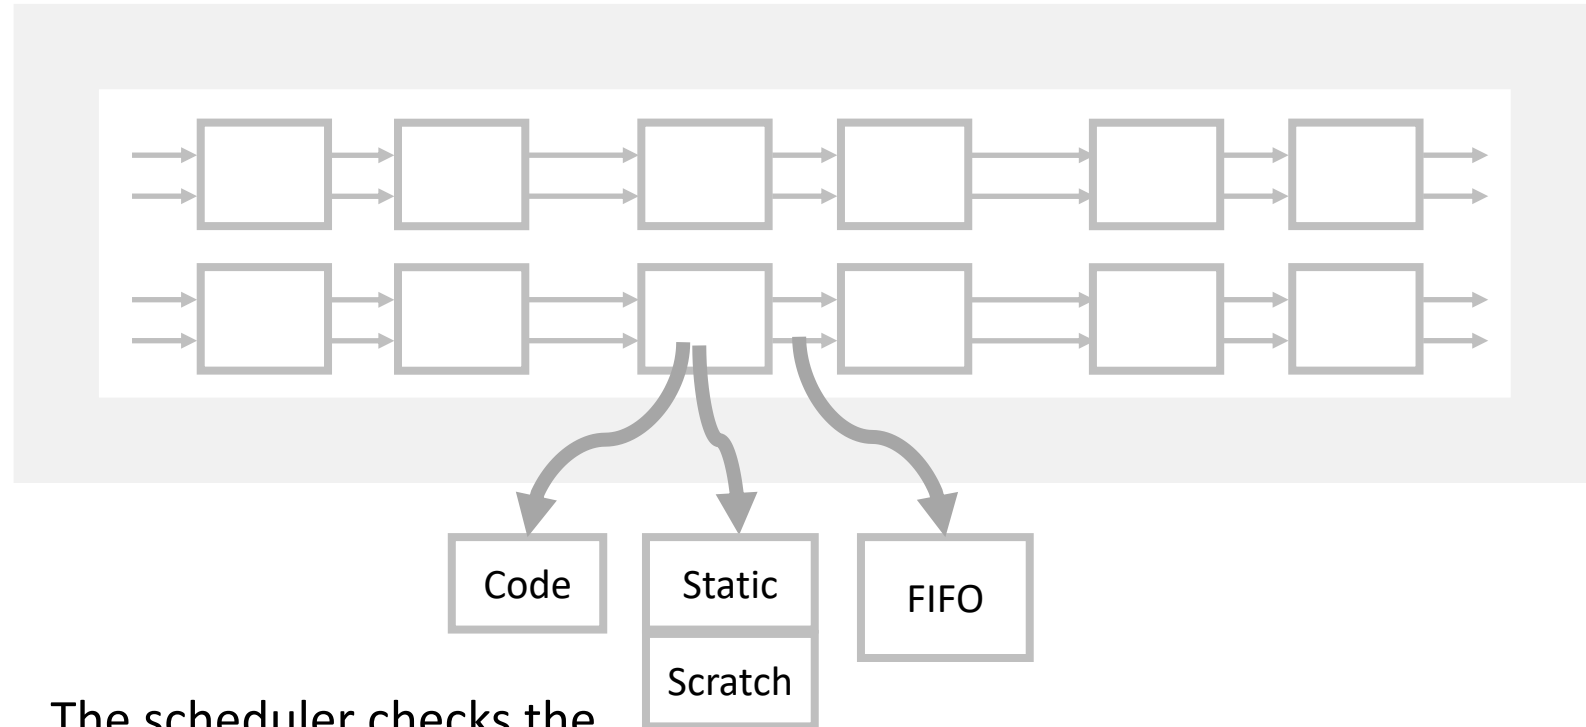

Stream-processing implemented with a graph of computing nodes

- 1 Inter-node interface** : data format (sampling rate, interleaving, raw format, frame size)
- 2 Processor interface** with nodes : memory allocation and TCM, compute libraries and AI-Tile
- 3 Graph-I/O interfaces** : buffering and polling scheme, mixed-signal configuration of the domains

Graph interpreter and scheduler

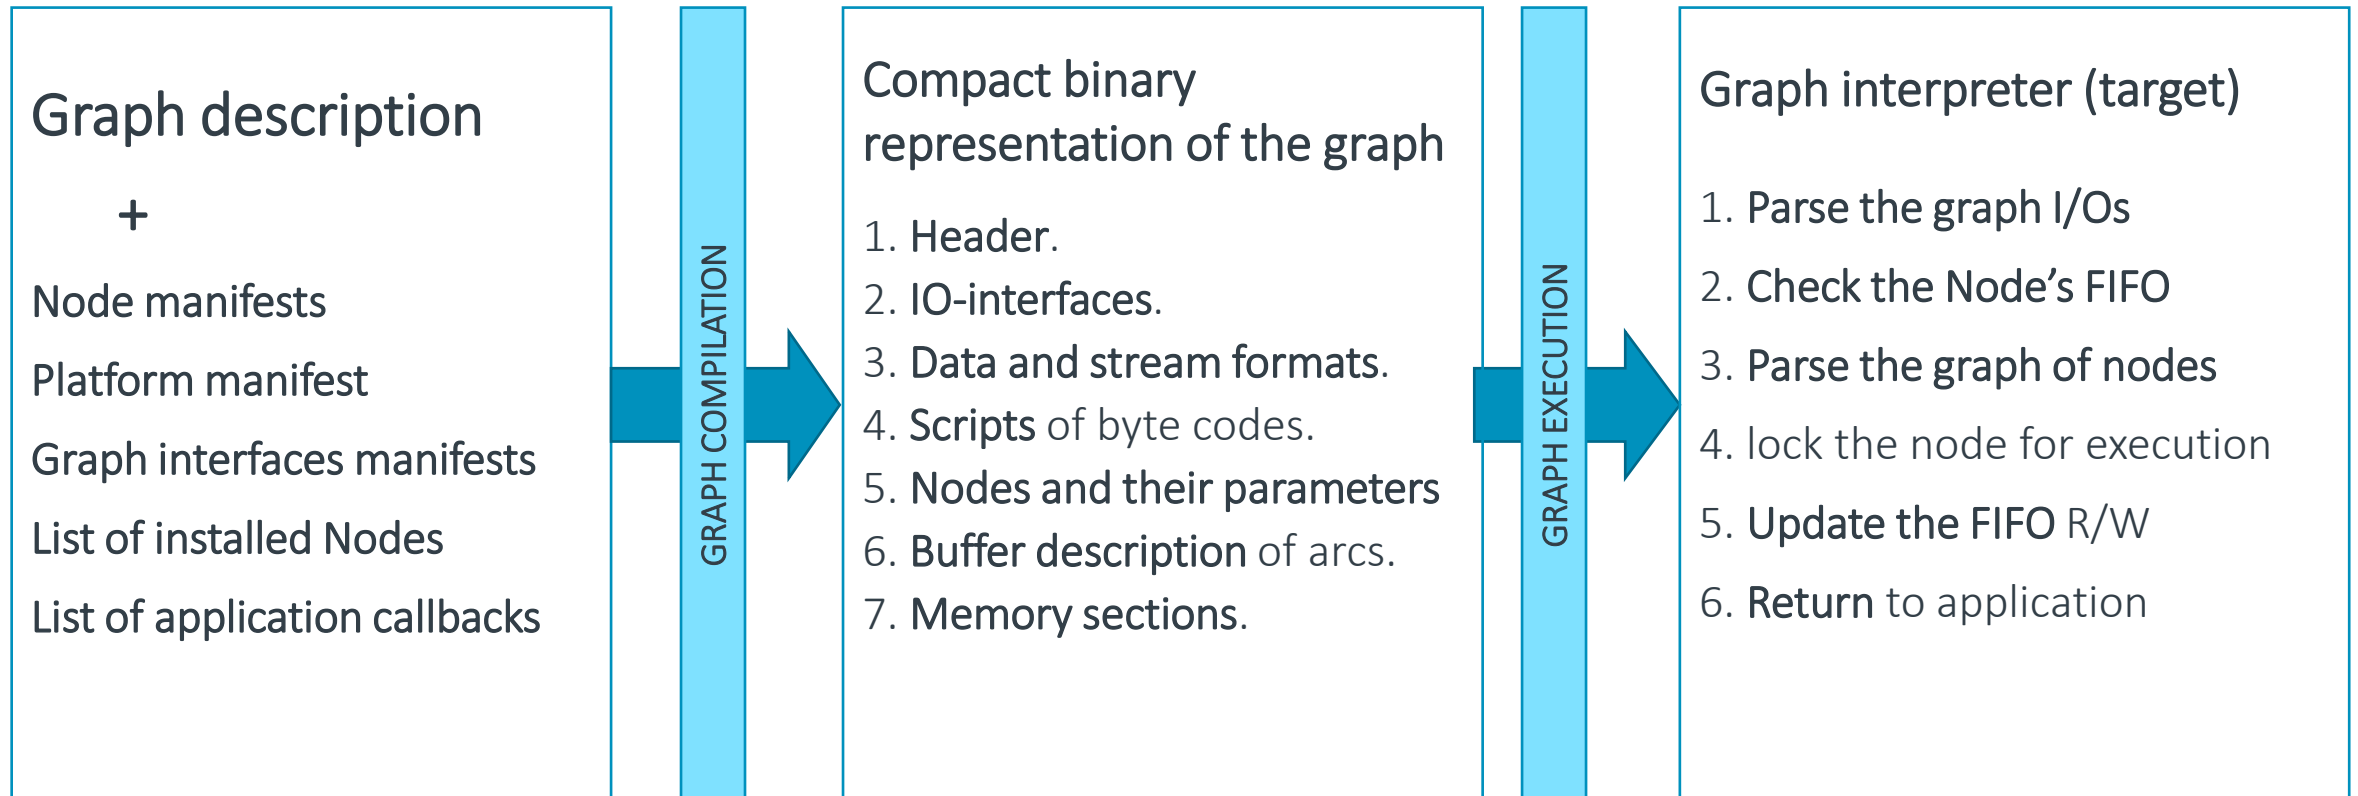

The compiled graph is a linked-list with references to memory buffers and node addresses

The scheduler checks the FIFO buffers before calling a node instance

Process

“manifests” are helping the “graph compiler” to prepare the memory map and the data flow between Nodes

arm

Graph design

Manifests of Nodes

1 Inter-node interface and interface with the platform :

a text file (readable syntax)

done once at node delivery

```

List of available Nodes

Processor manifest : memory mapping

Manifests of interfaces for Graph-I/Os

3 Graph-I/O interfaces :

a text file (readable syntax)

done once at platform manufacturing

```
io_platform_sensor_in_0          ; name for the tools
analog_in                        ; domain name, unit: dB, Vrms, mV/Gauss, dps, kWh, ...

io_commander0_servant1 1         ; commander=0 servant=1 (default is servant)
io_buffer_allocation 2.0 1        ; default is 0, which means the buffer is declared outside of the graph, VID 1
io_direction_rx0tx1 1            ; direction of the stream 0:input 1:output from graph point of view
io_raw_format {1 17}             ; options for the raw arithmetics computation format here STREAM_S16
io_nb_channels {1 1 2}           ; multichannel interleaved (0), deinterleaved by frame-size (1) + options for the number of channels
io_frame_length {1 2 16}         ; [ms]0/[samp]1 + options of possible frame_size
io_subtype_units 104             ; depending on the domain. Here Units_Vrms of the "general" domain (0 = any or underfined)
io_analogscale 0.55              ; 0.55V is corresponding to full-scale (0x7FFF or 1.0f) with the default setting
io_sampling_rate {1 16000 44100 48000} ; sampling rate options (enumeration in Hz)
io_rescale_factor 12.24 -44.3    ; [1/a off] analog_input = invinterpa x ((samples/Full_Scale_Digital) - interpooff)
end
```

Graph API (one entry-point to the scheduler)

1) Graph interpreter interface for the application :

```
void arm_graph_interpreter (uint32_t command, arm_stream_instance_t *S, uint8_t *data, uint32_t size)
```

Commands : reset the graph, execute, check boundary FIFO filling state and move data in/out, update the use-case

Instance : structure of pointers to the graph, to the installed nodes and application callbacks, to the data stream interfaces functions (below), control fields and static memory of the scheduler instance.

2) Stream interfaces used by the scheduler to initiate data moves (abstraction layer of the BSP):

```
void (io_function_ctrl) (uint32_t command, uint8_t *data, uint32_t length);
```

Commands : set buffer, set parameters, data move, stop

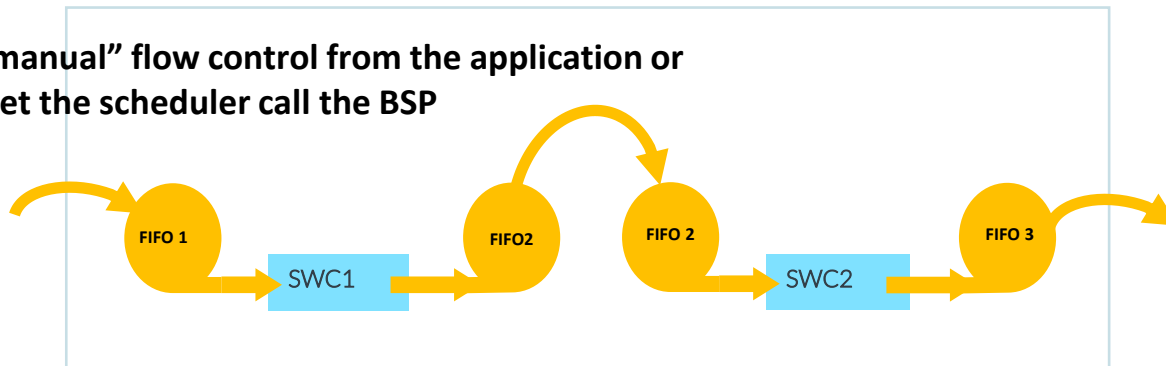

3) One callback, after data moves (to update the FIFO descriptors) :

```
void arm_graph_interpreter_io_ack (uint8_t fw_io_idx, uint8_t *data, uint32_t data_size)
```

4) One prototype for all nodes :

```
void node_XXXX (uint32_t command, void *instance, void *data, uint32_t *status)
```

“manual” flow control from the application or
let the scheduler call the BSP

Abstraction layer of IOs : data-move and settings + callback to set the FIFO
or
Data move from the application with same functions for FIFO setting

Small memory footprint for LoRA

Remote sensors connected through LoRA have a data rate as low as 50Bytes/s

A graph size of two nodes (+ their respective parameters and a script) is in the 500Bytes range

An interpreter eliminates the risk of malware injection during firmware updates

A memory map of the LoRA device :

RAM (graph and application)

Flash (graph, Nodes, application)

Filter and detector nodes with 1kB-RAM

Graph with embedded scripts

A graph can incorporate nodes with interpreted code using basic integer/float arithmetics.

The instruction “CALLSYS” gives access to nodes (set/read parameters), arcs (read/write, check access time-stamps), application callbacks, etc..

The script interpreter is consuming less than 100 Bytes of stack memory.

Examples of instructions

<code>r6 = add r5 3</code>	<code>r6 = (r5 + 3)</code>
<code>sp1 = r6</code>	push the result on stack
<code>test_eq r6 sub r5 r4</code>	<code>test if r6 == (r5 - r4)</code>
<code>if_yes call label_xyz</code>	conditional call
<code>r0 = mul r6 #float 3.14</code>	r0 loaded with r6 multiplied by 3.14
<code>r3 8 15 = r2</code>	bit-field load of r2 to the 2nd byte of r3
<code>r3 = [r4] r0</code>	gather load
<code>banz L1 r2</code>	decrement r2 and branch if not zero
<code>call L1 r2 r3</code>	call a subroutine and push 2 registers
Other operations: <code>div, or, nor, and, xor, shr, shl, set, clr, max, min, amax, amin, norm, addmodulo</code>	
<code>callsys 4 r1 r5 r10</code>	system call #4 with three parameters

Next steps : low-code for smart-home sensors

Do we need a complex programming environment to drag and drop software components from a Store ?
